## **AMENDMENTS TO THE CLAIMS**

This listing of claims replaces all prior versions, and listing, of claims in the application:

## **Listing of Claims**

- 1. (Currently Amended) A method for improving throughput in continuous electrodialysis processes in an electrodialysis stack, the method comprising automatically controlling the pH of acid loop solutions in strong acid/weak base configurations and of base-loop solutions in weak acid/strong base configurations including adding a buffer to the solutions, wherein said buffer is regenerated continuously and external to the electrodialysis stack and concentrations of the anionic and cationic moieties of said buffer are dependent upon a desired pH.
- 2. (Currently Amended) The method as recited in claim 1 wherein the process involves the formation of an acidic solution in an the electrodialysis stack and a said buffer is added to the solution.
- 3. (Currently Amended) The method as recited in claim 1 wherein the process involves the formation of a basic solution and a said buffer is added to the solution.

## 4. (Cancelled)

- 5. (Currently Amended) The method as recited in claim 4 <u>1</u> wherein the buffering agent is premixed with a solution situated remotely from the stack.
- 6. (Original) The method as recited in claim 1 wherein a buffering agent is added at ambient temperature.

In Re Hryn (S. N. 10/824,741) Response to March 24, 2006 Office Action Page 4 of 13

7. (Original) The method as recited in claim 1 wherein the electrodialysis process operates at a temperature which ranges from about 15°C to 40°C.

## 8. (Cancelled)

- 9. (Currently Amended) The method as recited in claim 8 1 wherein the anionic and cationic moieties are added to the ED system as solids, liquids, gases, solutions or any combination thereof.
- 10. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that will become acidic, a buffer pair is created by adding an acid and a metal hydroxide to the "acid-loop" stream.
- 11. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that is already acidic, a buffer pair is created by adding a metal salt of the acid's conjugate base to the "acid-loop" stream.
- 12. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that will become basic, a buffer pair is created by the addition of a base and its conjugate acid to the "base-loop" stream.
- 13. (Original) The method as recited in claim 1 wherein for an electrodialysis solution that is already basic, a buffer pair is created by the addition of an acid to the "base-loop" stream that contains, as its conjugate base, the base present in the ED electrolyte solution.
- 14. (Currently Amended) A process for maintaining the condition of electrodialysis membranes in electrodialysis cell compartments, the process comprising controlling the pH in an acid-loop or base-loop solution created by the electrodialysis cell in operation within two pH units, the process including adding a buffer to the

solutions, wherein the buffer is regenerated continuously and external to the electrodialysis cell components and concentrations of the anionic and cationic moieties of said buffer are dependent upon a desired pH.

- 15. (Currently Amended) The process as recited in claim 14 wherein a buffer solution is a means of maintaining the pH of the ED acid solution at a <u>said</u> desired <u>level pH</u>.
- 16. (Original) The method as recited in claim 15 wherein the buffer solution is supplied to the cell compartments via a tank external to the cell compartments.
- 17. (Original) The method as recited in claim 14 wherein controlling the pH in the acid-loop is a means of protecting bipolar membranes and their active sites.
- 18. (Original) The process as recited in claim 15 wherein the buffering solution is added at ambient temperature.
- 19. (Original) The method as recited in claim 14 wherein the electrodialysis cell operates at a temperature which ranges from about 15°C to 40°C.
- 20. (Currently Amended) The method as recited in claim 14 wherein a buffer solution is added to the stack to maintain the pH of solutions within the stack to within 2 pH units of a said desired pH.
